

# Backend Documentation

Filename: app.py

Functions -

1. signup()  
Route: /signup  
Method: POST

There are 5 parameters in the JSON sent to this API - first name (**firstName**), last name (**lastName**), email (**email**), contact (**contact**) and password (**password**).

Response -

1. If there already exists a row in the users table with the same email address, the message returned is "An account with this email already exists".
2. If there already exists a row in the users table with the same contact information, the message returned is "An account with this contact already exists".
3. In the case when neither of the above two hold, a new row is created in the users table with the information from the JSON and the message returned is "Added successfully".
